Show the Right Numbers

ggplot IMPLEMENTS A GRAMMAR OF GRAPHICS

The grammar is a set of rules for how produce graphics from data, taking **pieces of data** and **mapping** them to **geometric objects** (like points and lines) **that have aesthetic attributes** (like position, color and size), together with further rules for **transforming the data if needed**, adjusting **scales**, or projecting the results onto a **coordinate system**.

Like other rules of syntax, the grammar limits what you can validly say, but it doesn't make what you say sensible or meaningful.

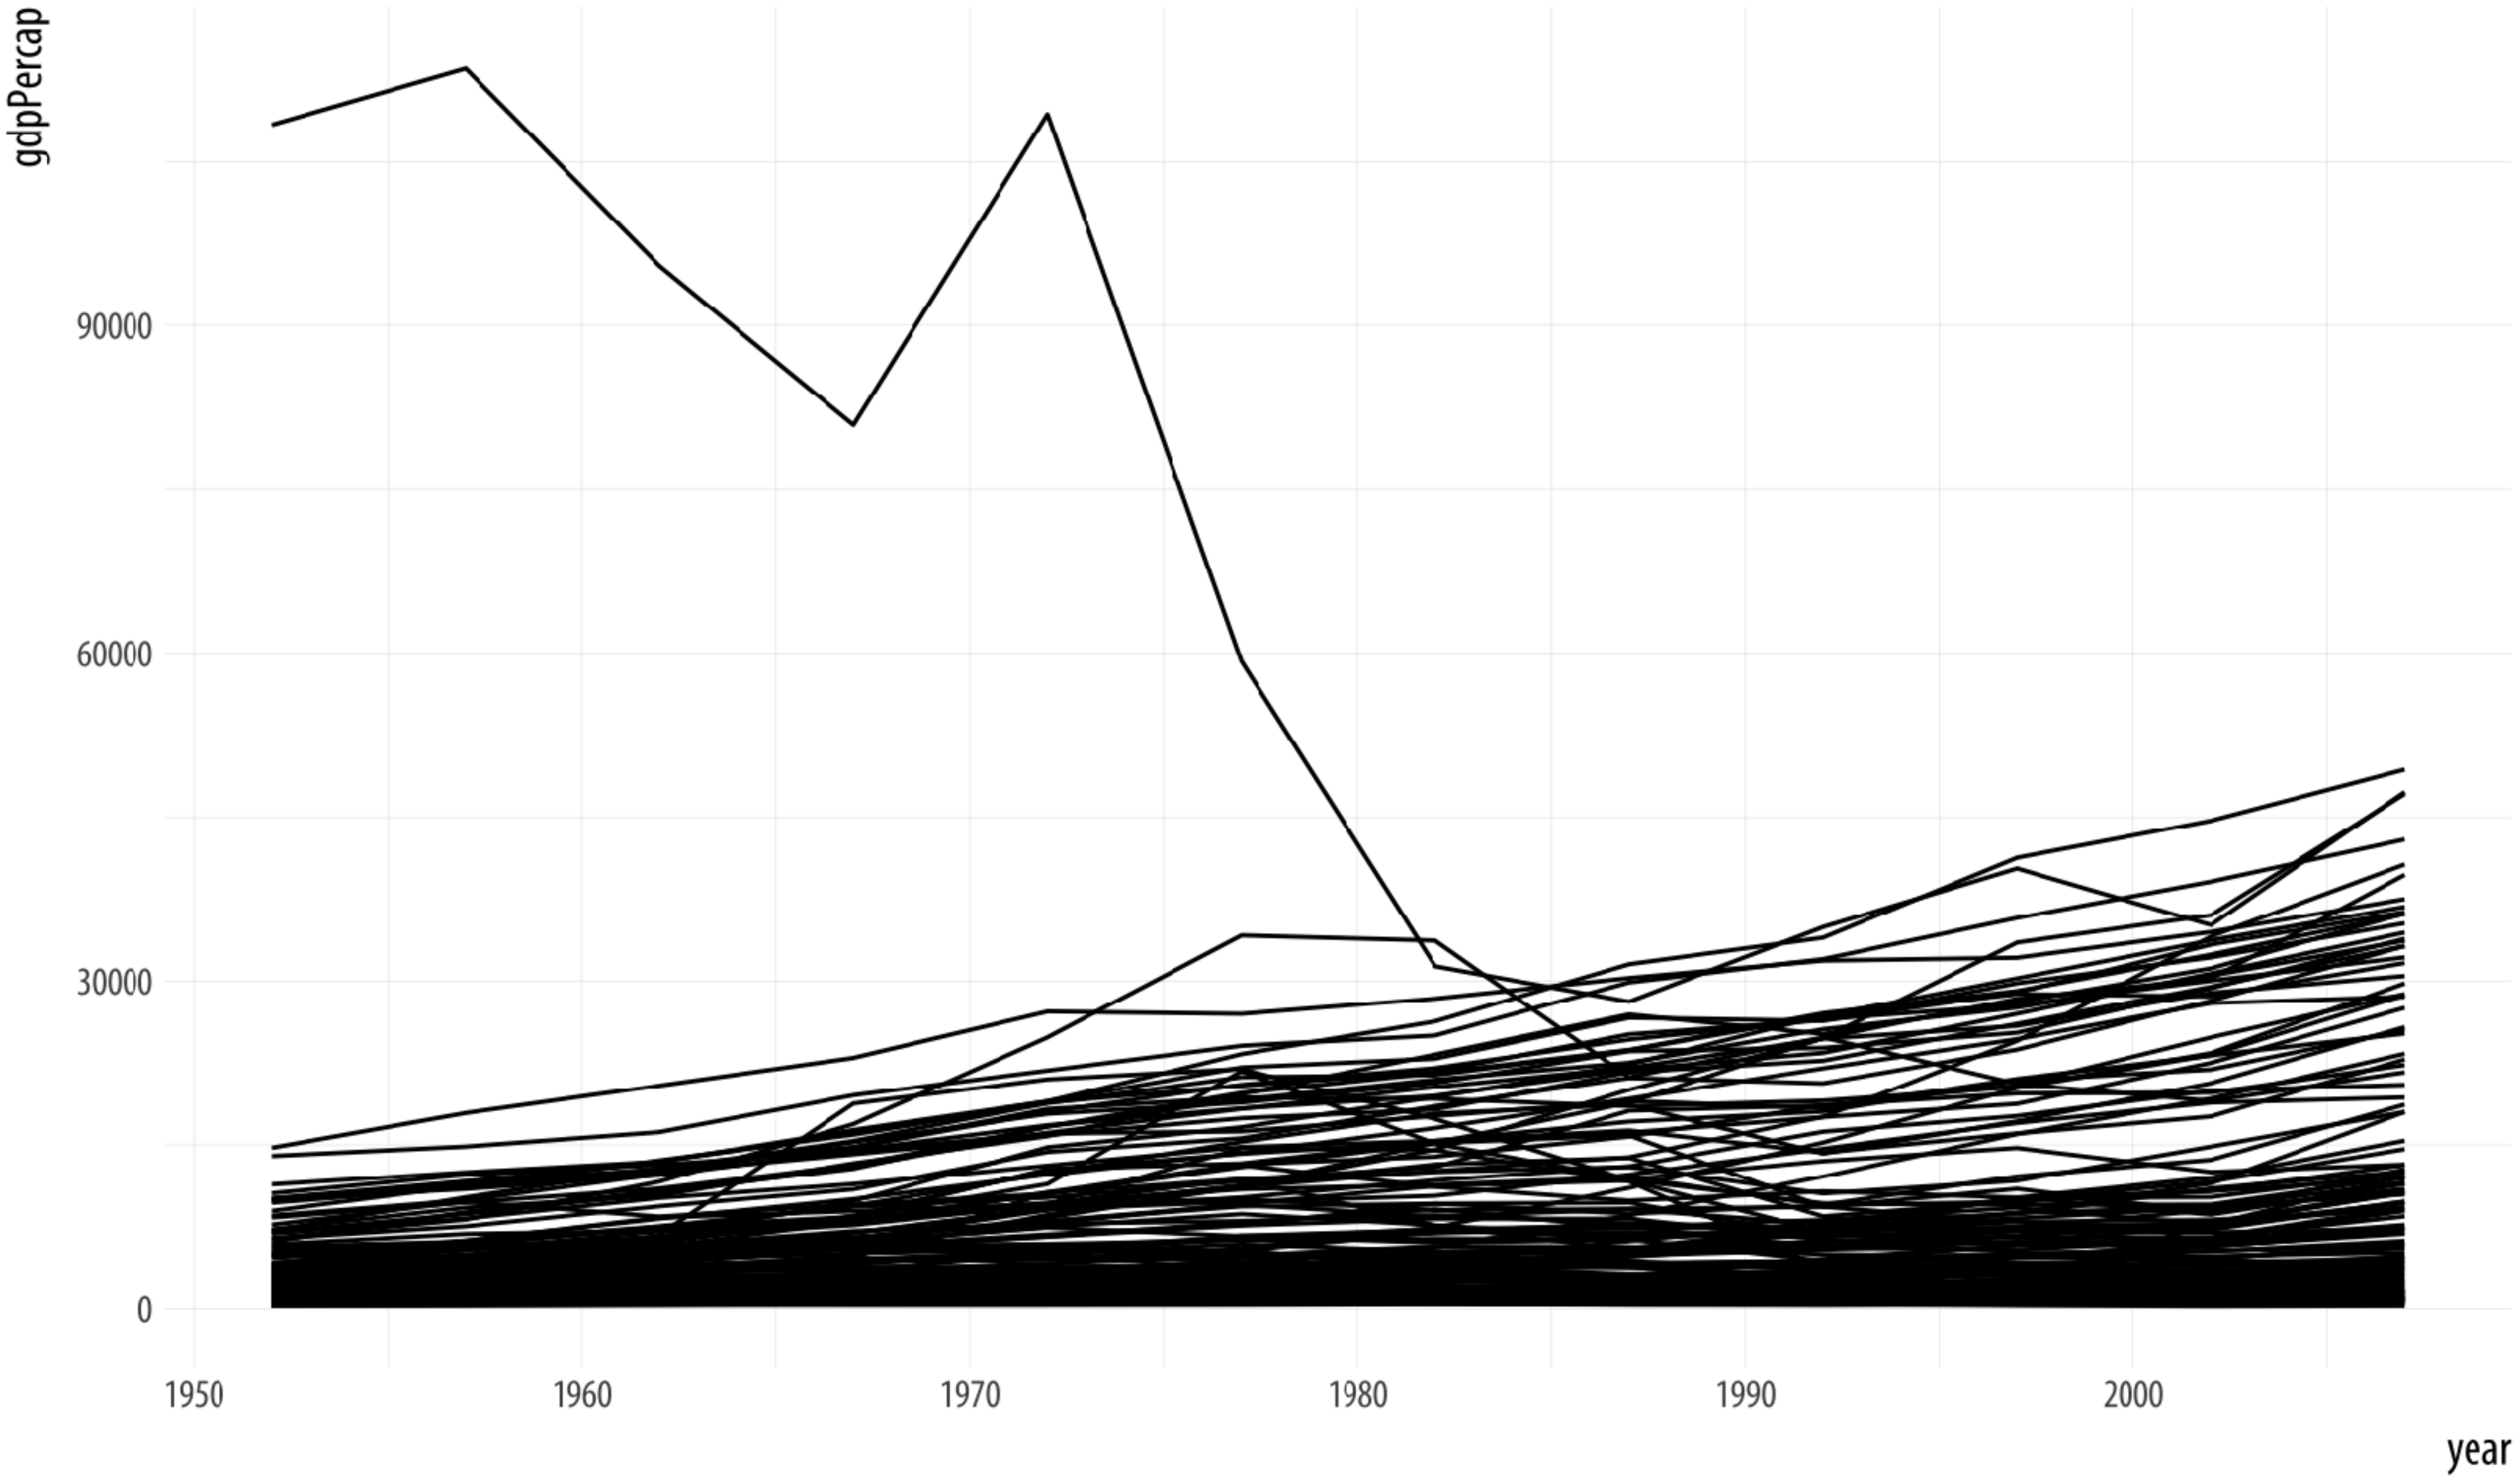
Grouped Data and the group **aesthetic**

```r
p <- ggplot(data = gapminder,
            mapping = aes(x = year,
                          y = gdpPercap))
p + geom_line()
```

gdpPercap
90000
60000
30000
0
1950
1960
1970
1980
1990
2000

0000
0
1950
1960
1970

```r
p <- ggplot(data = gapminder,
            mapping = aes(x = year,
                          y = gdpPercap))
p + geom_line(mapping = aes(group = country))
```



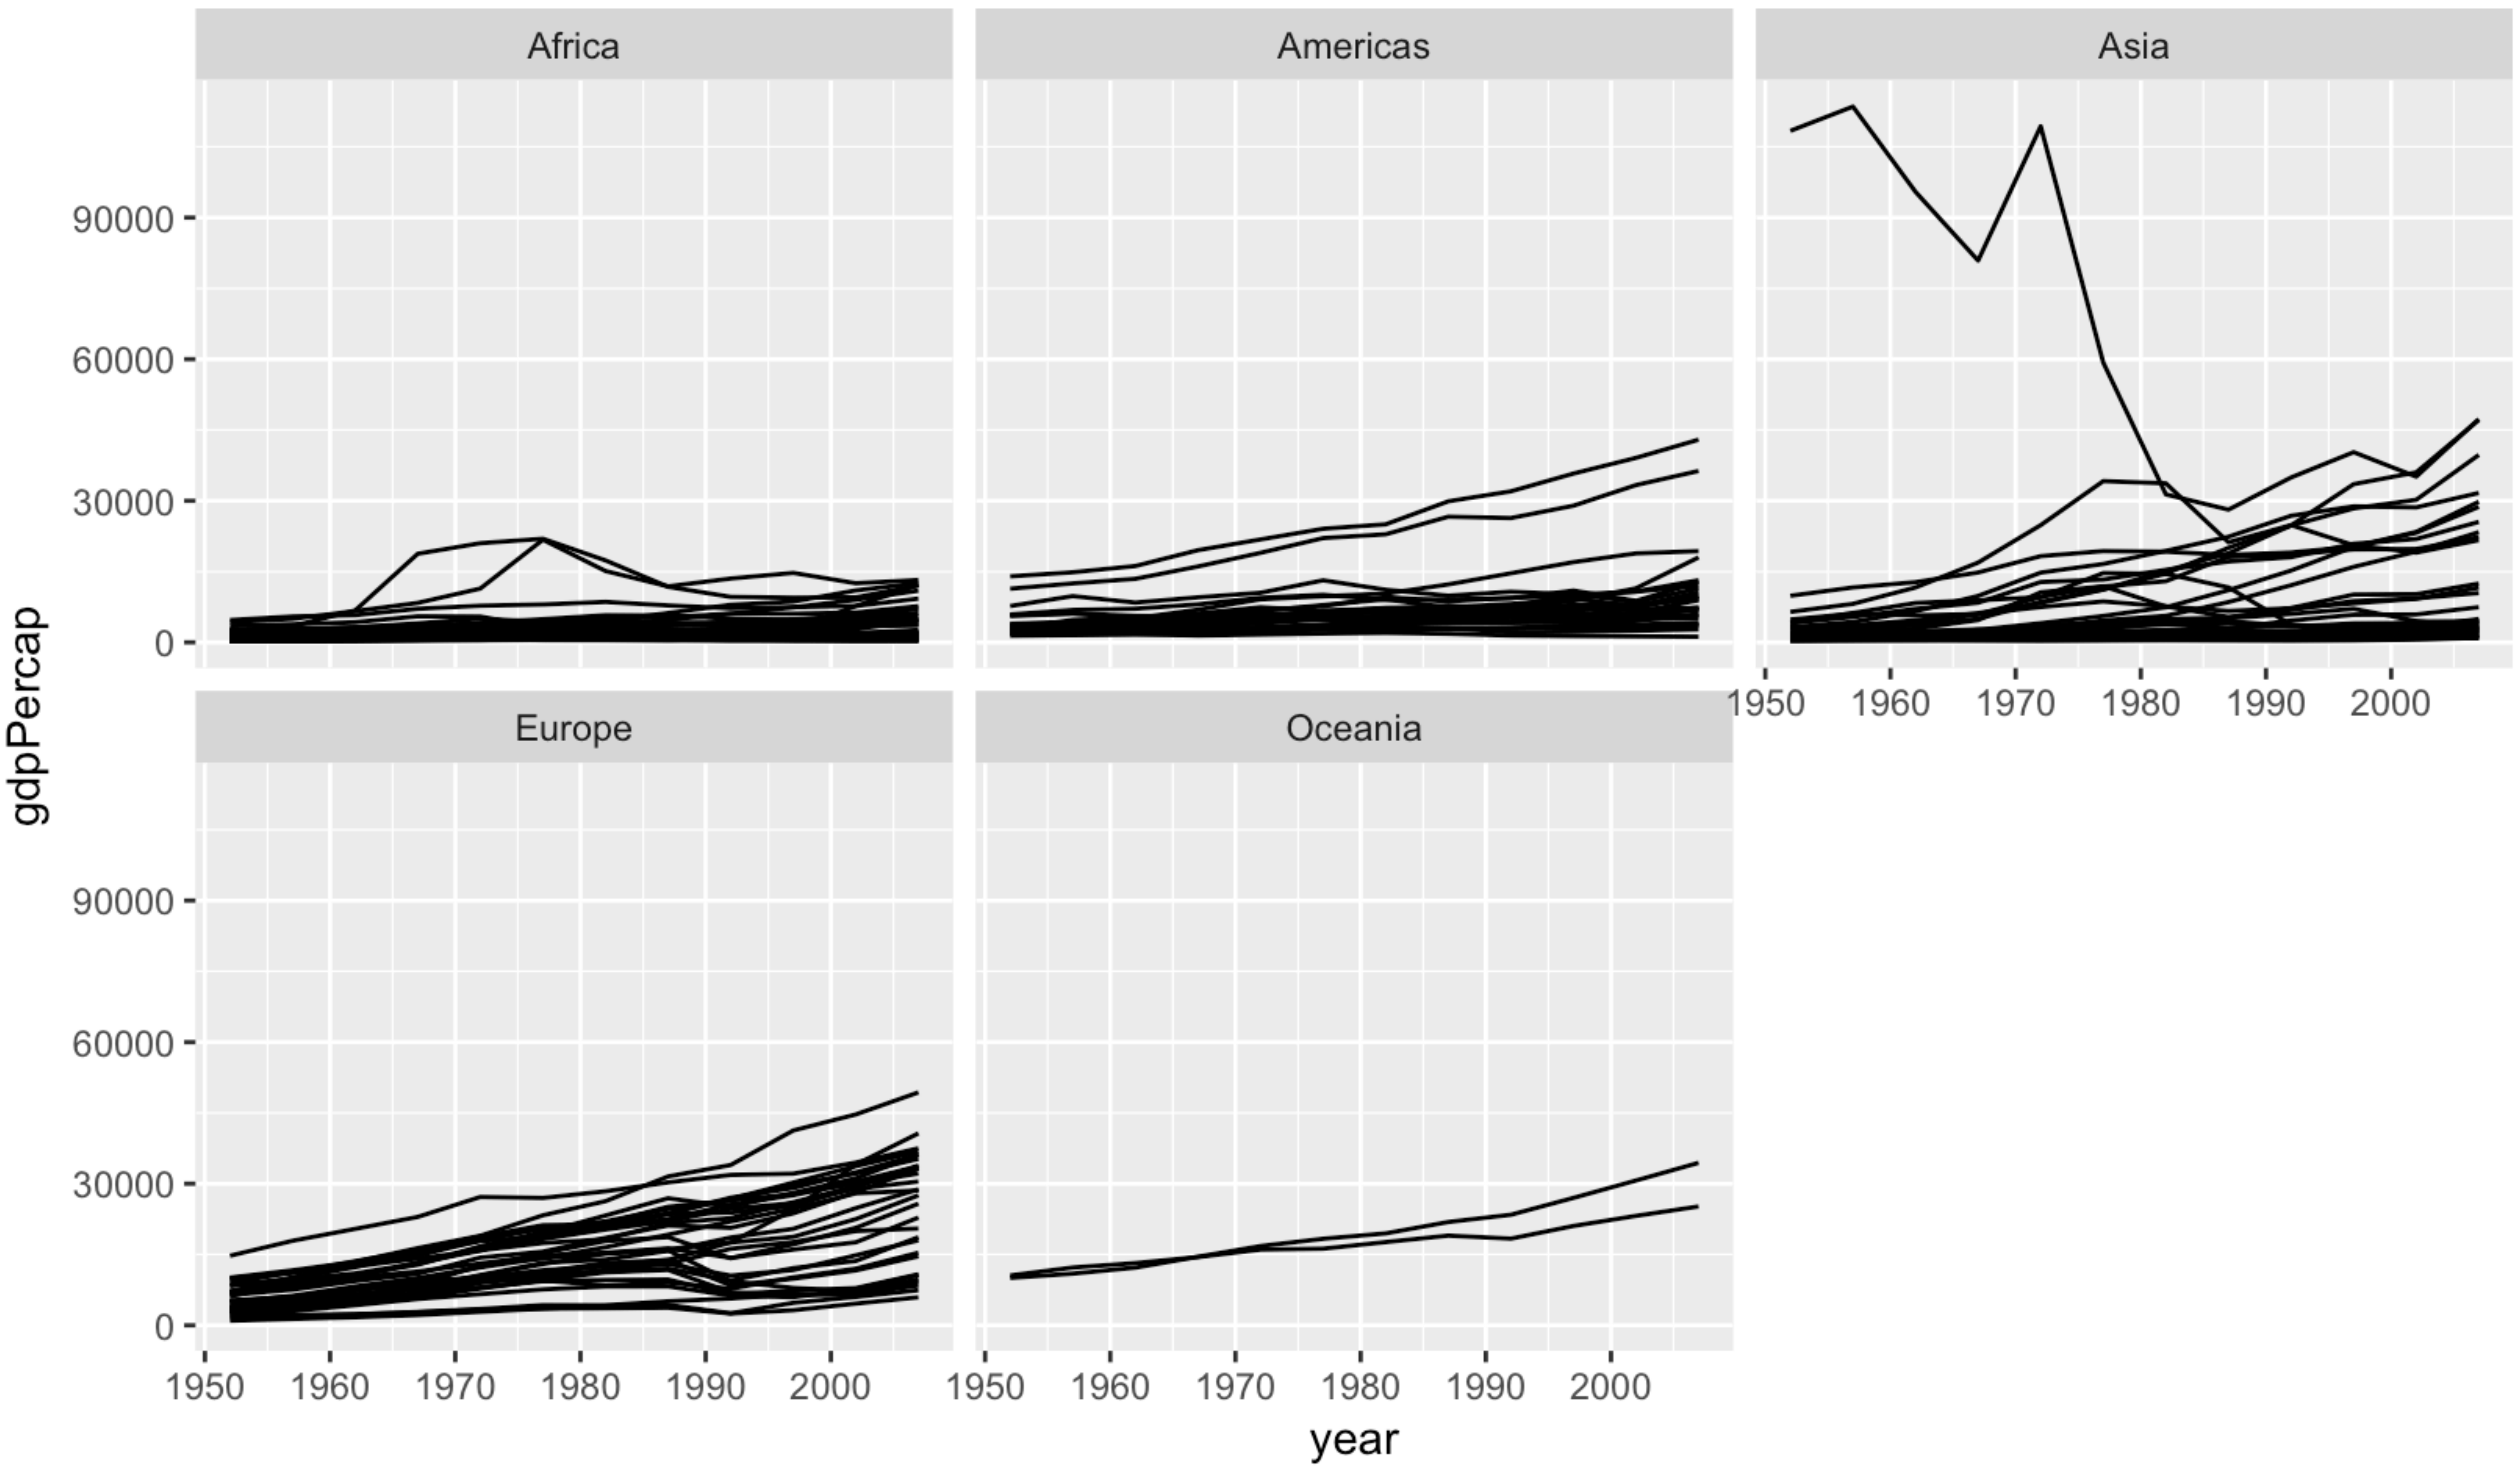
gdpPercap
90000
60000
30000
0
1950
1960
1970
1980
1990
2000
year

```r
p <- ggplot(data = gapminder,
            mapping = aes(x = year,
                          y = gdpPercap))
```

```r
p + geom_line(mapping =
                aes(group = country)) +
   facet_wrap(~ continent)
```

A facet is not a geom. It's a way of arranging geoms.

Facets use R's 'formula' syntax. Read the ~ as "on" or "by".



Africa
Americas
Asia
Europe
Oceania
gdpPercap
90000
60000
30000
0
1950
1960
1970
1980
1990
2000
year

```r
p + geom_line(color = "gray70",
              mapping = aes(group = country)) +
    geom_smooth(size = 1.1,
                method = "loess",
                se = FALSE) +
    scale_y_log10(labels=scales::dollar) +
    facet_wrap(~ continent, ncol = 5) +
    labs(x = "Year",
         y = "GDP per capita",
         title = "GDP per capita on Five Continents")
```

The labs() function lets you name labels, title, subtitle, etc.

GDP per capita on Five Continents

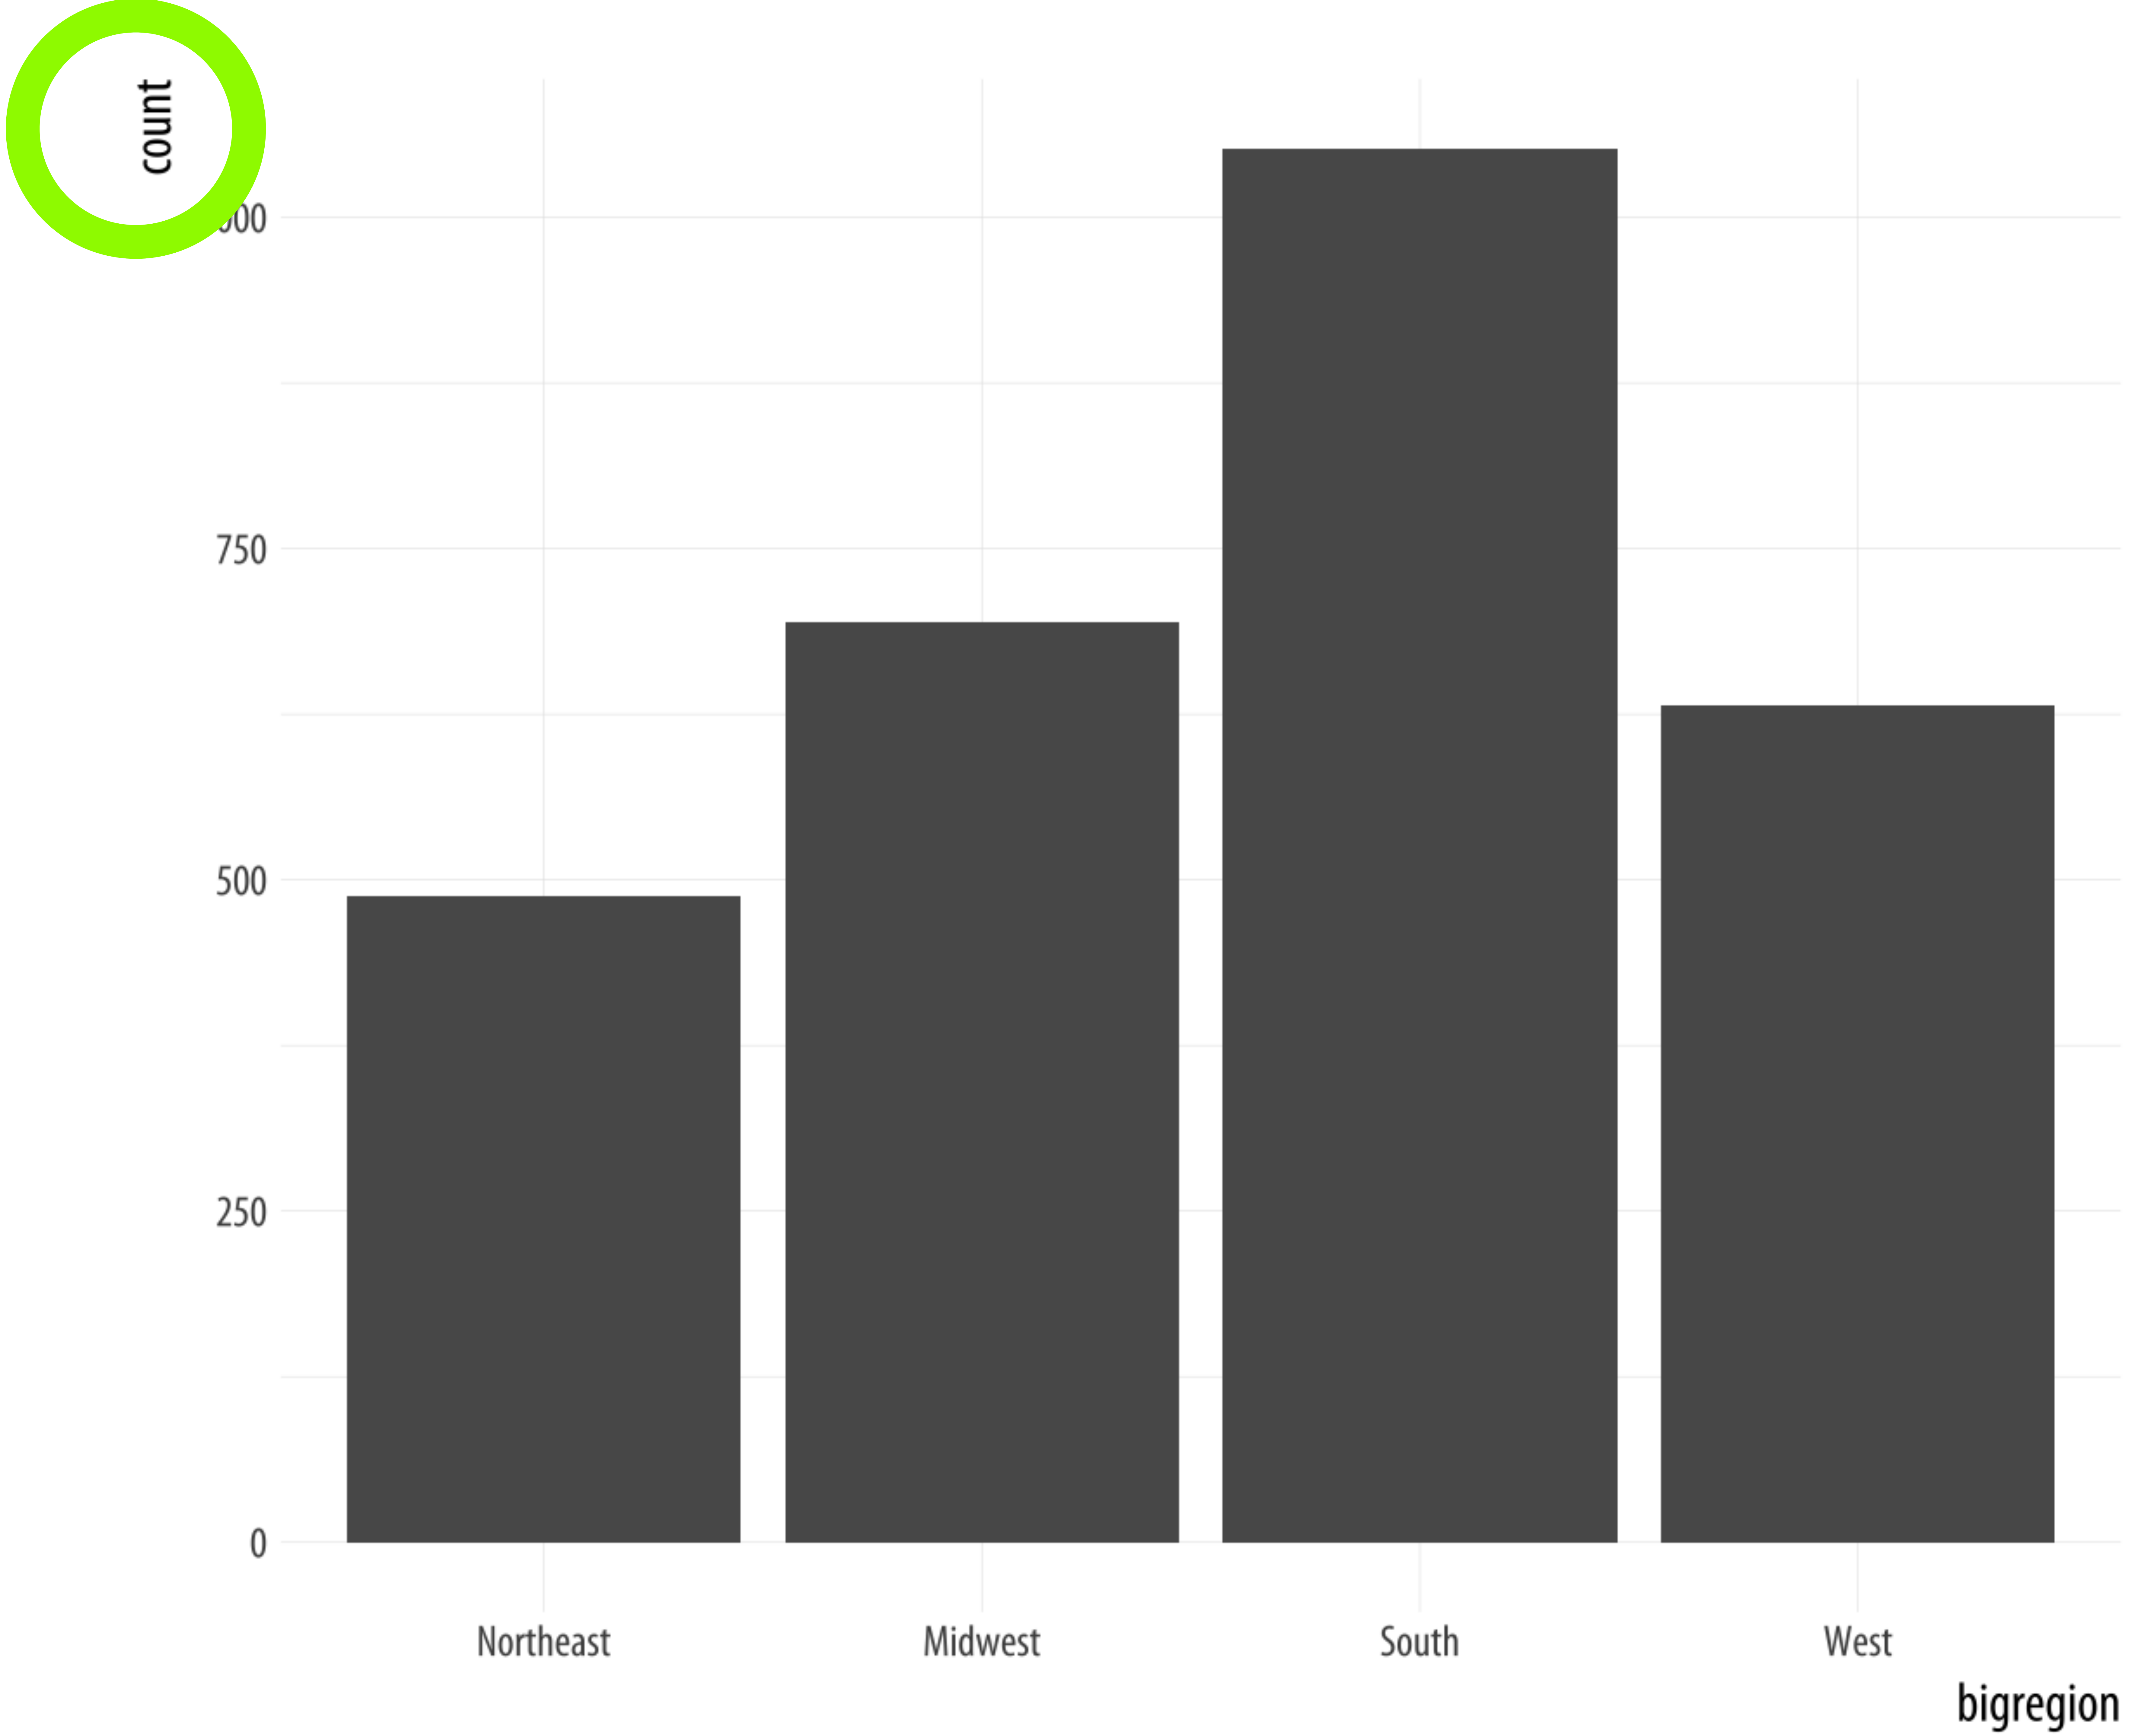
p + geom_bar()
```

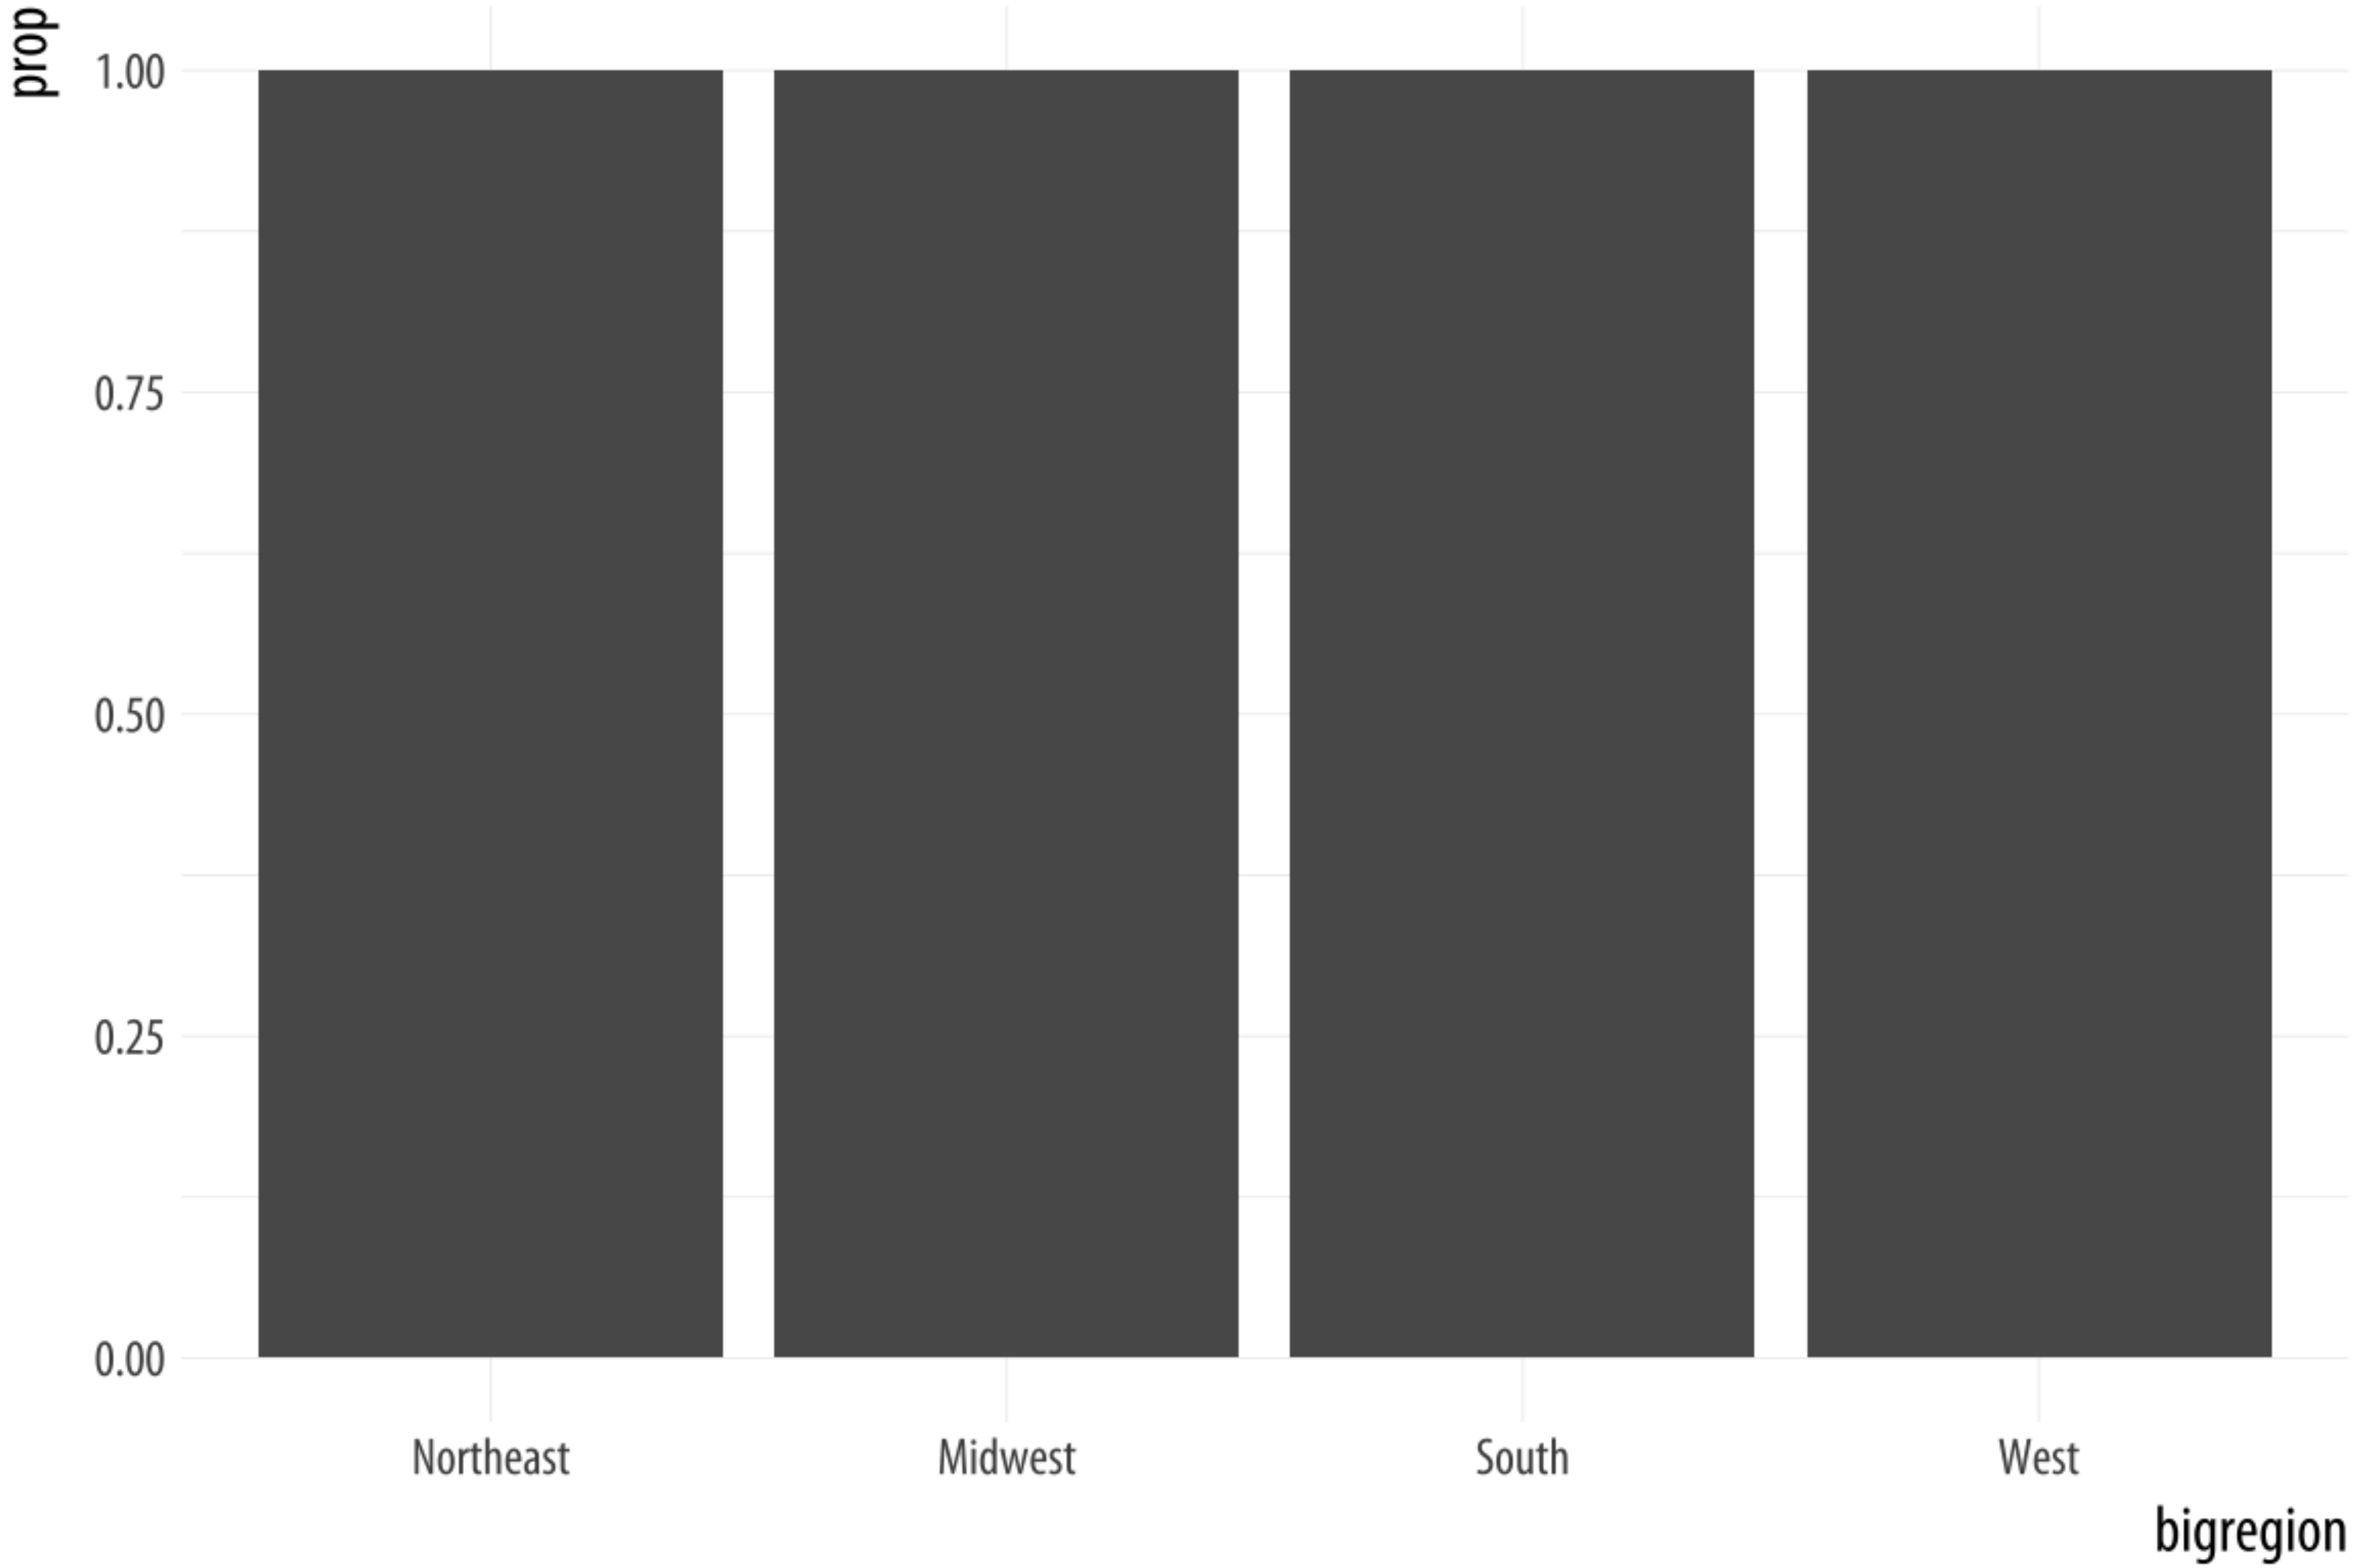
Just the one aesthetic mapping, to x.



count
1000
750
500
250
0
Northeast
Midwest
South
West
bigregion

The y-axis variable, `count`, is not in the data. Instead, ggplot has calculated it for us. It does this using the default `stat_` function associated with `geom_bar()`, `stat_count().` This function can compute two new variables, `count`, and `prop` (short for **proportion**). The `count` statistic is the default one used.

```r
p <- ggplot(data = gss_sm,
            mapping = aes(x = bigregion))
p + geom_bar(mapping = aes(y = ..prop..))
```



prop

```r
p + geom_bar()
```

```r
p + stat_count()
```

geom_ functions call their default stat_ functions behind the scenes. (And vice versa)

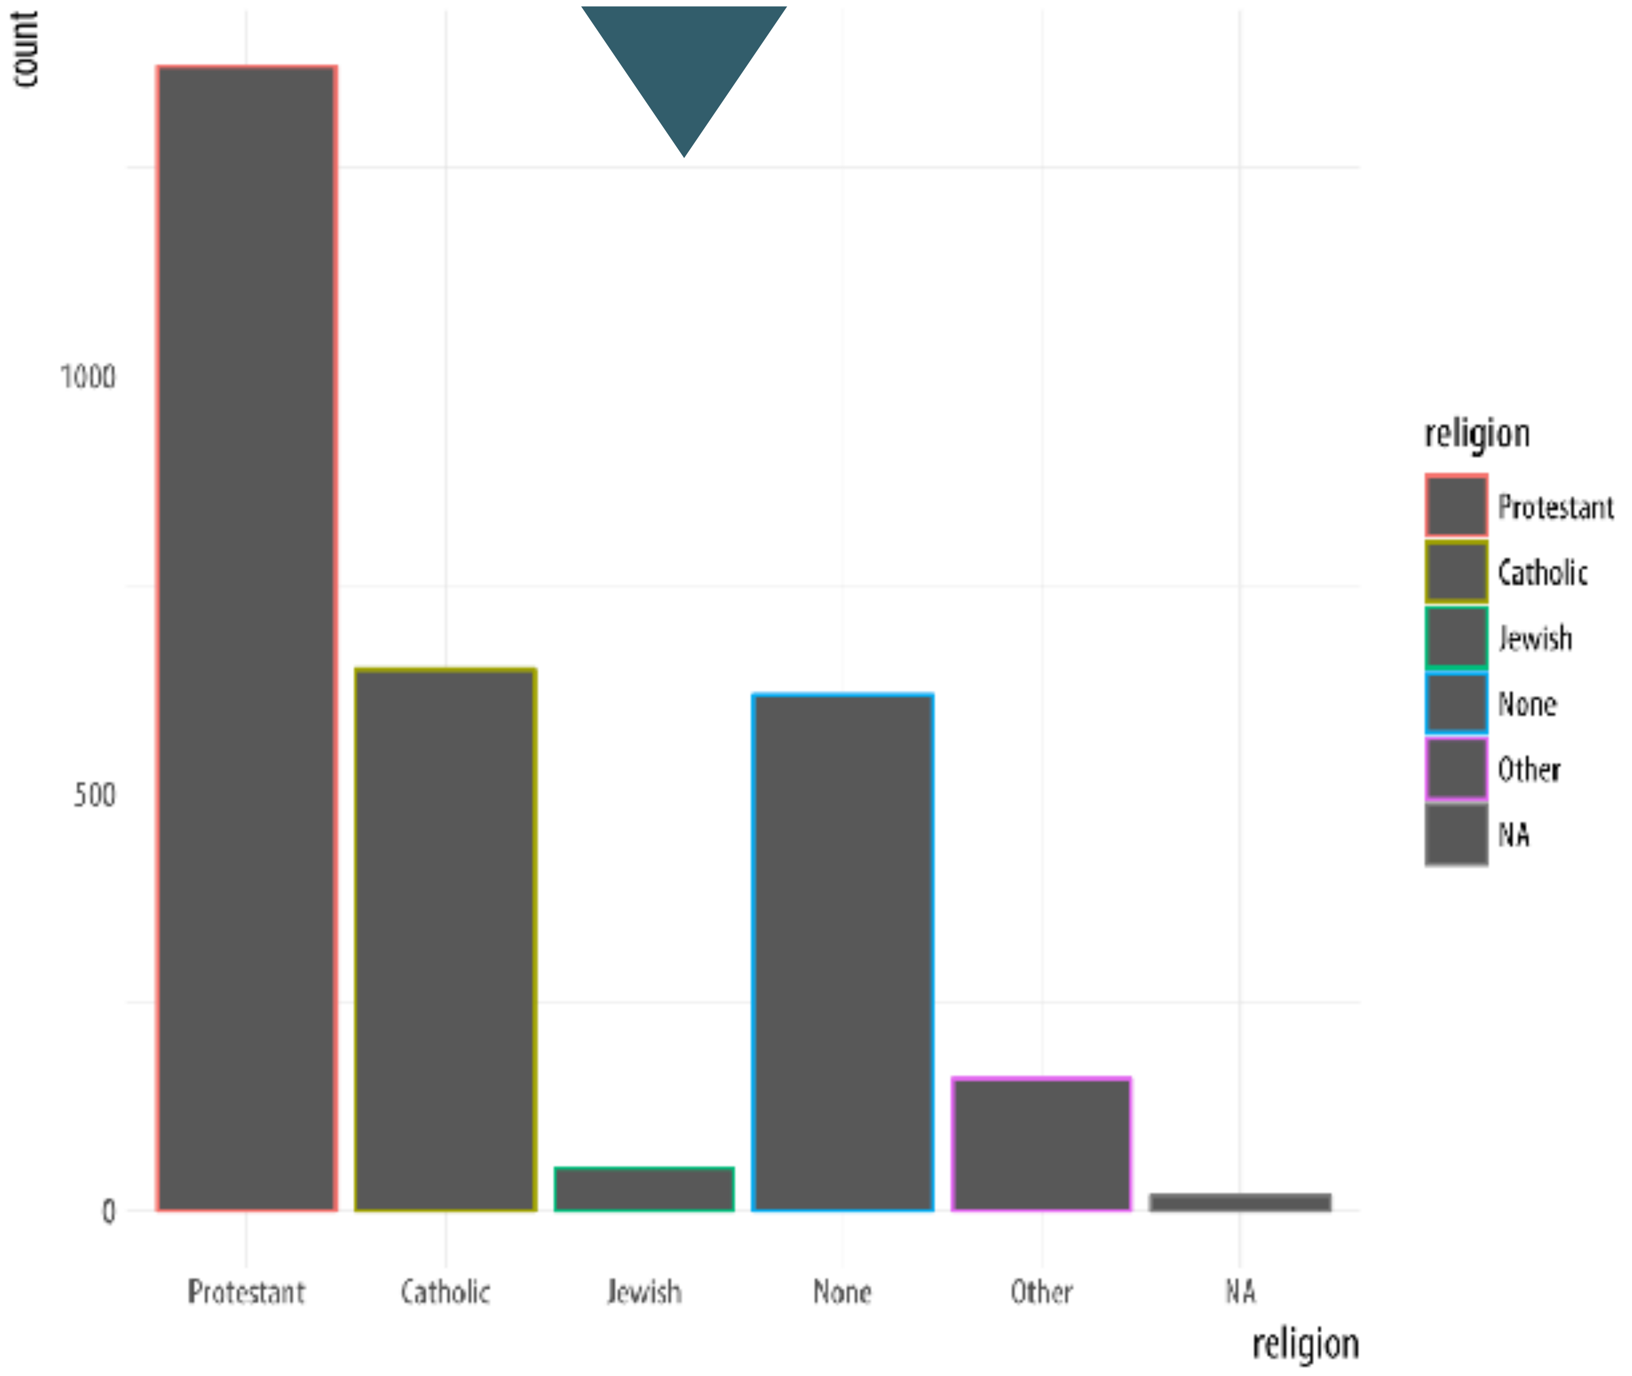
```r
p <- ggplot(data = gss_sm,
            mapping = aes(x = religion))
p + geom_bar()
```

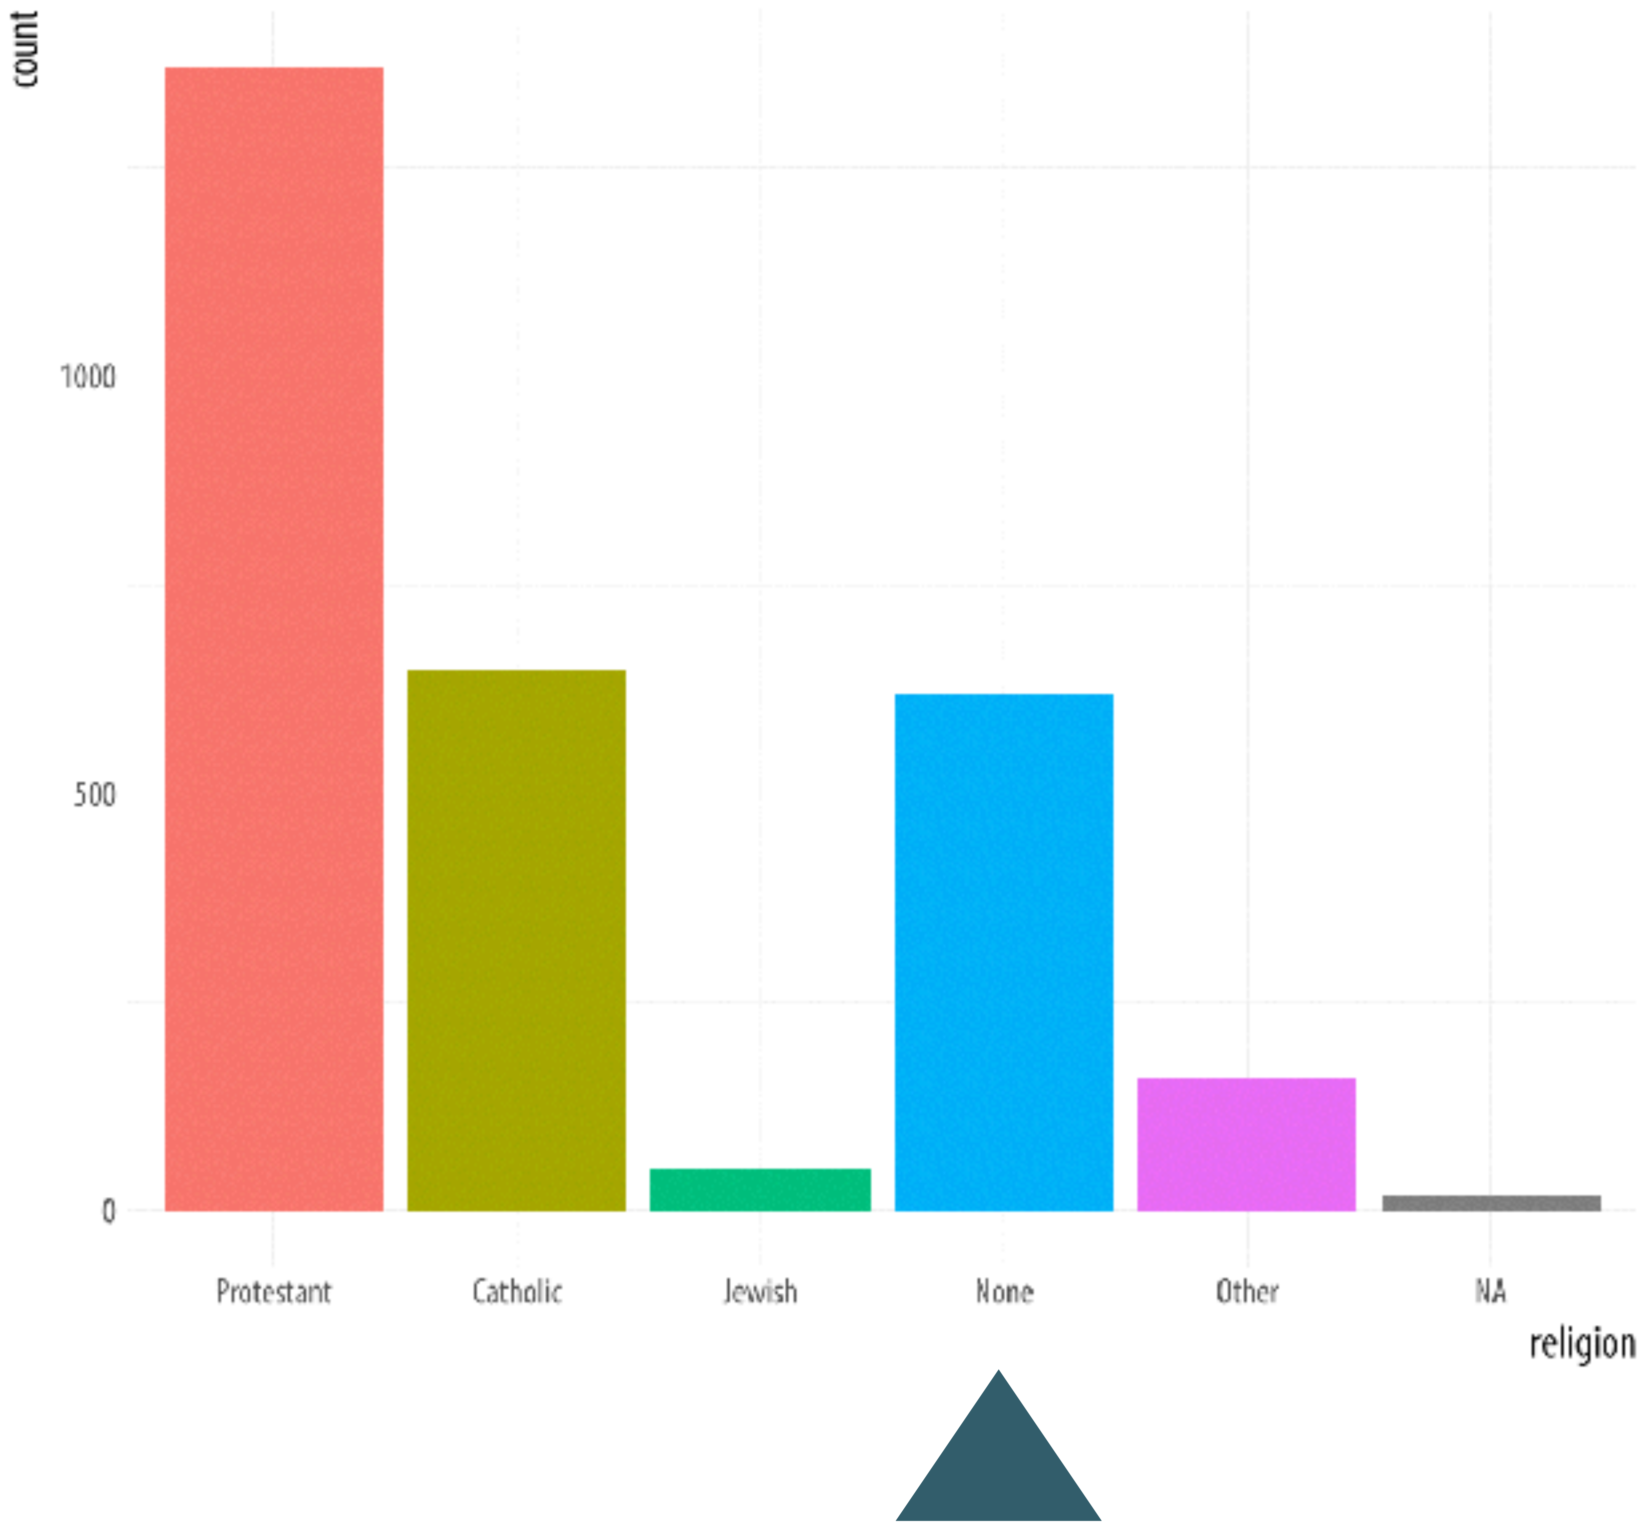
```r
p <- ggplot(data = gss_sm,
            mapping = aes(x = religion, color = religion))
p + geom_bar()
```

```r
p <- ggplot(data = gss_sm,
            mapping = aes(x = religion, fill = religion))
p + geom_bar()
```

```r
p <- ggplot(data = gss_sm,
            mapping = aes(x = religion, fill = religion))
p + geom_bar() + guides(fill = FALSE)
```

```r
p <- ggplot(data = gss_sm,
            mapping = aes(x = religion, color = religion))
p + geom_bar()
```





```r
p <- ggplot(data = gss_sm,
            mapping = aes(x = religion, fill = religion))
p + geom_bar() + guides(fill = FALSE)
```

HISTOGRAMS & KERNEL DENSITIES

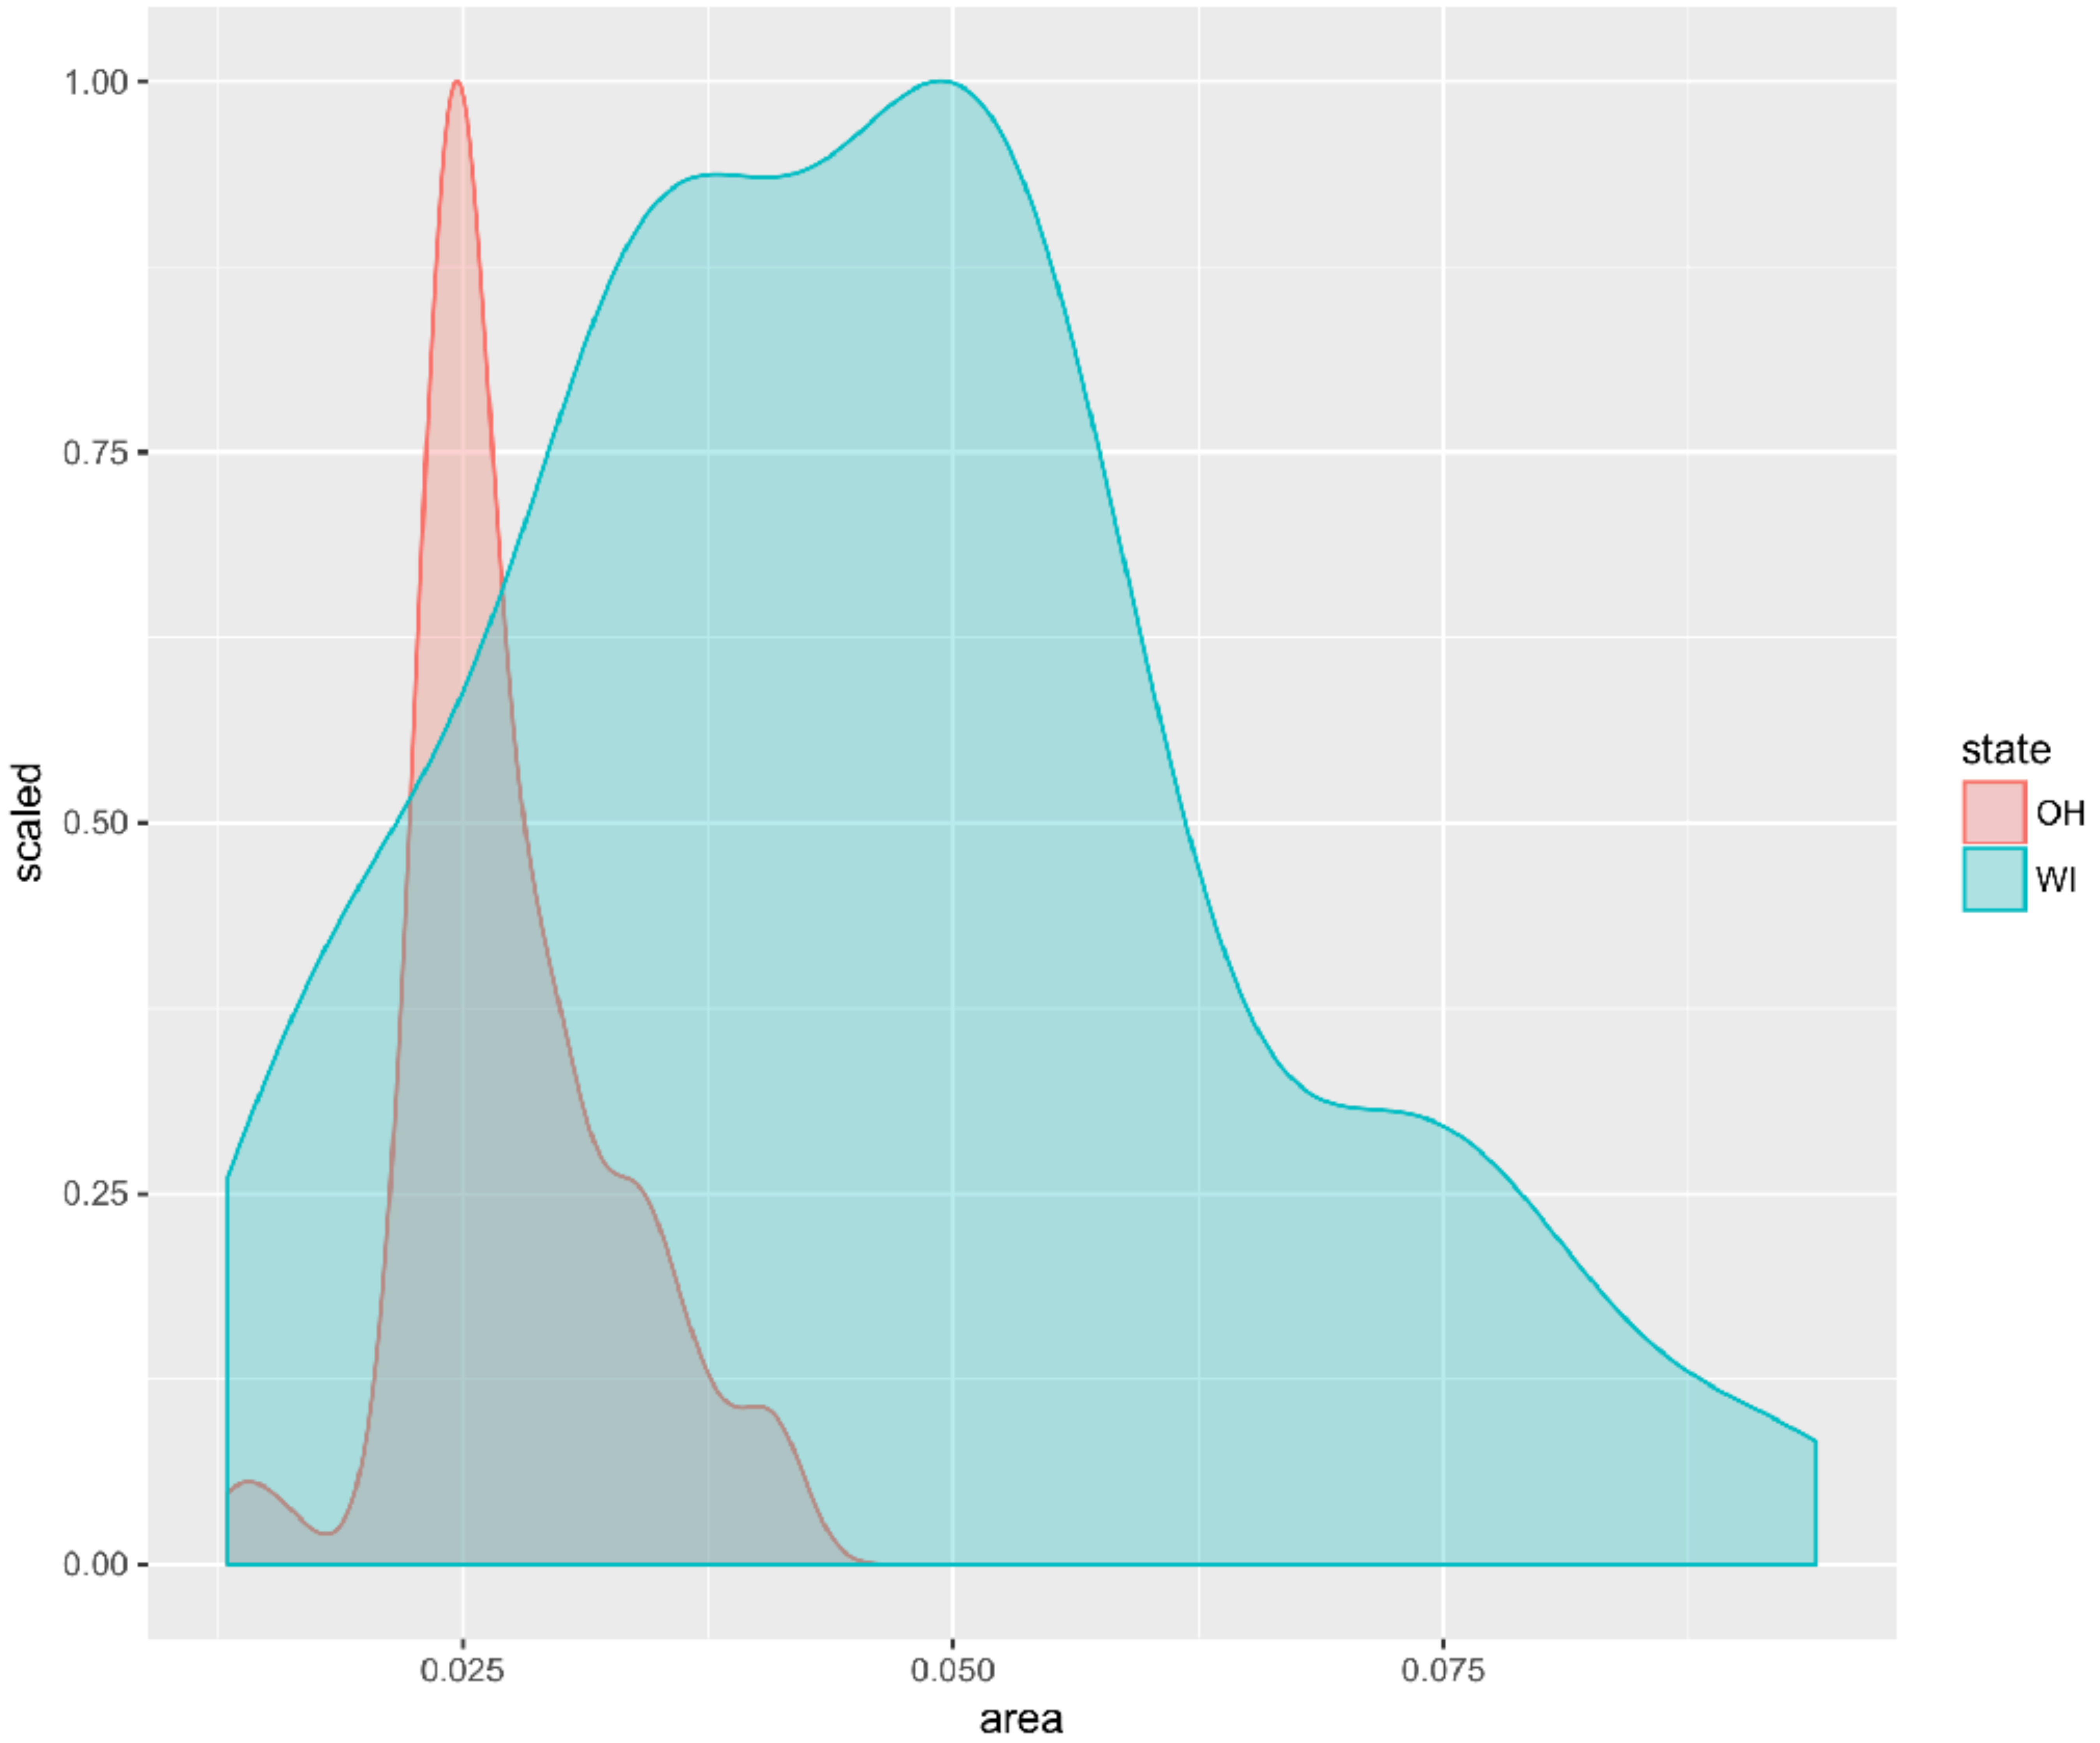
IL
IN
MI
OH
WI

```r
p <- ggplot(data = subset(midwest, subset = state %in% OH_WI),
            mapping = aes(x = area, fill = state, color = state))

p + geom_density(alpha = 0.3, mapping = (aes(y = ..scaled..)))
```



AVOIDING TRANSFORMATIONS WHEN NECESSARY

```
> titanic
```

```
##       fate gender    n percent
## 1 perished   male 1364    62.0
## 2 perished female  126     5.7
## 3 survived   male  367    16.7
## 4 survived female  344    15.6
```

No counting up required?
Then stat = identity

```r
p <- ggplot(data = titanic,
            mapping = aes(x = fate,
                          y = percent,
                          fill = sex))
p + geom_bar(stat = "identity",
             position = "dodge") +
    theme(legend.position = "top")
```

The theme() function controls parts of the plot that don’t belong to its “grammatical” structure

```r
p <- ggplot(data = titanic,
            mapping = aes(x = fate,
                          y = percent,
                          fill = sex))
p + geom_col(position = "dodge") +
    theme(legend.position = "top")
```

Even better: for convenience when not counting up, just use geom_col()

sex
female
male
percent
60
40
20
0
perished
survived
fate

```
oecd_sum
